

## PressView instruction

# Import a new color strip using the Management Module

This instruction explains how to import a new color strip using PressView's Management Module.

### Preparations

Make sure your **PressView server** is up and running and that you can connect to it. If you use a local version of PressView, the server is started automatically after you start the PressView Client.

In order to use your new color strip, you need two files:

- Physical color strip (.pdf or .eps) to be printed with your products
- Strip definition for PressView (.csv format)

You can find color strips and their definitions on our **website**: [www.colorware.eu](http://www.colorware.eu)

Go to the **support section** and select **downloads**.

### Importing the new strip definition using the Management Module

Launch the **Management Module**. It will show a simple log-in screen. Log in with an administrative user name and password (PressView account, not your Windows account). After successful log-in, you'll be taken to the home page with the menu shown on the left.

From the menu on the left, choose **import colorstrips**.

Select the comma separated file (.csv) you wish to import and press import.

If everything is OK, the Management Module states that the strip definition is added successfully.

### IMPORTANT NOTE:

When you see that your strip was added successfully, **follow the direct link** provided on screen and **activate** your strip! If you skip this step, your strip might not be visible.

If you need to change to properties of the strip definition (activation, user rights, edit patches, delete), select **color strips** from the menu on the left and click on the strip of your choice.
